

Solar Power Company Lumina Solar Delaware Serves Homes and Businesses

August 12, 2026

Newark, Delaware - August 12, 2026 -

Rising electricity costs and growing interest in renewable energy are prompting more Delaware property owners to research which solar power company to work with, and Lumina Solar Delaware is serving that demand for residential and commercial customers in Newark, New Castle County, and communities across the state. The company designs and installs solar energy systems for homeowners and businesses that want to generate their own electricity on site.

A solar power company manages the stages of a solar project that a property owner would otherwise coordinate separately. At Lumina Solar Delaware, that begins with a site assessment covering roof condition, sun exposure, and energy usage, followed by custom system design, permitting, the physical installation of panels and inverters, coordination of required inspections, and system activation with ongoing performance monitoring. Handling those stages under one roof means a single point of responsibility from the first evaluation to a working solar energy system. The installation timeline varies with system size and local permitting requirements, and the company coordinates with municipal offices and utility inspectors in each jurisdiction it serves so that a system is not switched on before the required approvals are in place.

According to the U.S. Department of Energy, solar power ranks among the fastest-growing sources of electricity generation in the United States, supported by falling equipment costs and rising interest in clean energy. The Solar Energy Industries Association reports that solar capacity across the country has expanded substantially over the past decade as more homes and businesses adopt the technology. Research from the National Renewable Energy Laboratory has documented continued gains in panel efficiency and reductions in the cost of solar energy systems, developments that have widened the pool of properties where solar is a practical option and increased the number of solar companies competing for that work.

Founded in 2018, Lumina Solar has completed more than 6,000 installations and employs more than 150 NABCEP-certified professionals across a service area covering Delaware, Maryland, Pennsylvania, Virginia, and Washington, DC. Unlike solar companies that subcontract installation work, Lumina Solar Delaware operates in-house teams, and its technicians are licensed and insured. The company installs solar panels, inverters, and battery storage, allowing a property owner to add stored solar power for evening use or backup during a grid interruption as part of the same project. Residential projects typically center on rooftop arrays sized to a household's usage, while commercial installations are engineered around the larger electrical loads and roof or ground space of a business property.

Property owners comparing a solar power company against other solar companies are commonly advised to look at certification, licensing, local installation history, and how much of the work the company performs itself. Certification through recognized programs such as NABCEP and a verifiable record of completed local projects are often cited as indicators that a solar energy company can carry a project through permitting and inspection to code. Manufacturer warranty coverage on panels, inverters, and batteries remains a standard point of comparison, and Lumina Solar Delaware reviews equipment specifications with each customer during the design stage.

Delaware homeowners and businesses evaluating a solar power company can request more information about site assessment, system design, installation, and battery storage options.

About Lumina Solar Delaware

Lumina Solar Delaware is a solar panel installation company providing residential and commercial solar energy systems to homeowners and businesses across Delaware. Founded in 2018, Lumina Solar operates in-house teams of NABCEP-certified professionals and has completed more than 6,000 installations across Delaware, Maryland, Pennsylvania, Virginia, and Washington, DC. The company installs solar panels,

inverters, and battery storage as part of its renewable energy and clean energy work, giving property owners a local source of green energy.
